Abstract

Mobile computing has become the major computing role in our daily life. Everything from simple shopping list to more complicated remote computing can be done on mobile devices. It is estimated that only a dozen of application is available for server management and most of them are not available for free to download. This is where free application can be made available for the consumer to use. Most of the application in the market is free, but it also came with limited functionality and the user information is not secured properly which becomes a security flaw. In this paper we develop full platform coverage for server management running in Windows and Linux. It can manage multiple servers at one time using single interface and could be operated from remote locations.
